The Align class provides services related to aligning (synonomous with registering) a suspect image with a reference image. The suspect requires some combination of translation, scaling, and rotation to achieve this.
                                                                                                                                                                                                                                     This version incorporates the Version 1.0 Alignment core algorithms from Geoff Rhoads, 2/17/96.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              // the checking takes the first N 128by128 bump regions, FFT's them, //converts them to magnitudes, adds them all, then does the fourier \-mellin check between the added versions and //the master public grid FM profile.

// A Yes/No is generated based on the S/N found between a peak and the // background
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /*
This function performs two basic services, first, it simply attempts
to deterenine if a public subliminal grid exists or not,
if one does exist, then the second basic service is to determine the
rough scale and rotation state of that grid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      // temporary

// a first crack at deciding whether or not a signature/grid is present is possible // at this point: the ratio between value0 and valueN should be above some // threshold. If this is unreliable, then complete the alingment/read process, // read the control bits and their checksums, and see if the checksums are right; // this will obviously take a longer time to make a negative decision.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           load_grid_family(); // will immediately return if already done

```

```
// pointer to a logical palette
// handle to a logical palette
// handle to a palette
// loop index
number of colors in color table
// pointer to packed-DIB
// pointer to BITMAPINFO Structure (Win3.0)
// pointer to BITMAPINFO Structure (Od)
// flag which signifies whether this is a Win3.0 DIB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This function creates a palette from a DIB by allocating memory for the logical palette, reading and storing the colors from the DIB's color table into the logical alpatete, creating a palette from this logical palette, and then returning the palette's handle. This allows the DIB to be displayed using the best possible colors (important for DIBs with 256 or more colors).
                                                                                                                                                                                                                    lpPal = (LPLOGPALETTE) ::GlobalLock((HGLOBAL) hLogPal);

```

```
This function gets the height of the DIB from the BITMAPINFOHEADER height field if it is a Windows 3.0 style DIB or from the BITMAPCOREHEADER height field if it is an other-style DIB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This function calculates the number of colors in the DIB's color table by finding the bits per pixel for the DIB (whether Win3.0 or other-style DIB). If bits per pixel is 1: colors=2, if 4: colors=16, if 8: colors=256, if 24, no colors in color table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This function gets the size required to store the DIB's palette by multiplying the number of colors by the size of an RGBQUAD (for a Windows 3.0-style DIB) or by the size of an RGBTRIPLE (for an otherstyle DIB).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LPBITMAPINFOHEADER 1pbmi; // pointer to a Win 3.0-style DIB LPBITMAPCOREHEADER 1pbmc; // pointer to an other-style DIB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                *
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        return (WORD) (::DIBNumColors(lpbi) * sizeof(RGBTRIPLE));
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /* calculate the size required by the palette */

* fft() is a routine that calculates the discrete Pourier transform

* of two arrays taken to be the real and the imaginary parts of an

* complex array. It returns the transform in the arrays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for( i = 0 ; i < bb ; i++ )

Include file for Geoff's FFT routines. Callers of the FFT functions
should include this header file to pick up the function prototypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               int fft2d(float *ar,float *ai,int nbits,int inv,float *wr,float *wi );

```
// Lock the packed data global memory (leave locked until destructor). m hpPackedData = (unsigned char *)::GlobalLock( (HGLOBAL) \mathfrak m hPackedData);
This function copies the DIB image data into a packed format. This is important for two reasons: 1) the DIB formatted data is arranged so that each scan line starts on a long word boundary, so there may be up to 3 unused bytes at the end of each scan line in the case of 8 bit data. This arrangement is inconvenient when passing the image data to the core algorithms. Also, 2), if a palette is being used (this is the case for all but 24 bit image data), this routine looks up the actual image values using the array. The member variable m_bpacked data array. The member variable m_bpackedbata is the handle to the packed data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  // For 8 bit (and any other non 24 bit data) we
// take the image data to be indices into the color
// table. We look up the actual value. Note we
// assume grey-scale (i.e., r,g,b triples are all equal
// we read the green.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       // Create space and get handle for the packed data of the image. size = m xDim + m_YDim;  
// For 24 bit true color, we will pack R.G.B values, so triple the size. if (m_BitsPerPixel == 24 && force_to_l_chan == FALSE)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  // The destructor for the Image class of objects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This function copies the DIB image data into a packed format. This is important for two reasons: 1) the DIB formatched data is arranged so that each scan line starts on a long word boundary, so there may be up to 3 unused bytes at the end of each scan line in the case of 8 bbt data. This arrangement is inconvenient when passing the image data to the core algorithms. Also, 2), if a palette is being used (this is the case for all but 24 bit image data), this routine looks up the actual image values using the palette and places these values in the packed data array. The member variable m_heackedbata is the handle to the packed data.

The force_to_l_chan argument is an optional boolean. It defaults
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               m_hPackedData = ::GlobalAlloc(GMEM_MOVEABLE | GMEM_ZEROINIT, size);

```
*hpData++ = hpLine[j+1];// take just green to convert // to 1 channel data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This function moves the contents of the packed data array back into the D1B data space. This would be used, for example, after one the core algorithms have been used to sign the data in the packed array, and we want to update the D1B to reflect the changes. Note that this requires that we create our own palette, since otherwise we don't know that the new data values have corresponding entries in the palette.
                                                                                                                                                                                                                                                                                                                                                                       // For 8 bit (and any other non 24 bit data) we
// take the inage data to be indices into the color
// table. We look up the actual value. Note we
// assume grey-scale (i.e., r,g,b triples are all equal
// we tread the green.

The goal is to provide a set of service which insulate the caller from having to deal with the specifics of the DIB format. Also, the approach tends to isolate platform specific and file format specific details to this format specific details to this format would affect this class, but not the callers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Copyright (c) 1995 Digimarc Incorporated, all rights reserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     // Calculating the size of the DIB is a bit tricky (if we want to // do it right). The easiest way to do this is to call GlobalSize() // on our global handle, but since the size of our global memory may have // been padded a few bytes, we may end up writing out a few too // many bytes to the file (which may cause problems with some apps).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           if ((lpBI->biCompression == BI_RLE8) || (lpBI->biCompression == BI_RLE4))

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The PackedMsg class is responsible for creating an efficient binary * coding representation of the ASCII message the user wishes to embed * in the image. This representation is "efficient" in that it packs * the message into a format which requires fewer total bits than that used by the equivalent ASCII representation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Currently, the packing scheme translates each ASCII character of the user message to a value which can be represented with 6 bits. Some * ASCII characters have no representation, of course, since only 64 alphanumatic and special characters can be represented by the 6 bit code. See the enumeration in the Packmsg.h file for the exact
                                                                                                                                                                                                                                                                                                                                                             BITWAPFILEHEADER is stripped off of the DIB. Bverything from the end of the BITWAPFILEHEADER structure on is returned in the global memory handle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        if ((file.Read((LPSTR)&bmfHeader, sizeof(bmfHeader)) !=

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This function is passed a pointer to the compact message string containing a message. It computes and returns the checksum. The checksum algorithm used is a simple "spiral add", and the size of the checksum is PACKED_BITS_PRR_CHAR (although it is stored as an unsigned char).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            // NOTE:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                * DESCRIPTION:

The Params classes are responsible for gathering and managing all * user input parmaters. There are two classes defined here: 1) the* Signer-params class for the signer, and the ReaderParams class for the reader.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The SignerParams class also keeps track of internal parameters which control or "tune" the operation of the signer, but which are not" accessible by the user.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   At present, this is a non-GUI version. All*
user inputs enter from the command line. In the future, a GUI version*
will be added which will present a dialog box to the user and gather input parameters from a graphical interface. The command line version*
will probably always exist for testing purposes and possibly batch*
processing. Different constructors will be used to differentiate *
peccessing. Guil and cmd line versions.

Typically, the RawImage constructor is given an input file as an argument, and the constructor is responsible for reading the file and performing the necessary operations to convert it into the raw format.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RawImage objects also are able to perform the inverse conversion, creating image files in various standard formats from the internal raw representation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The initial implementation will only except TIFF files as inputs,

// Next default values for new objects
//

The following functions are core algorithms which include 1) additional capabilities for signing Color images, and 2)

```
// look up table mapping key value
// look up table mapping the scaling to luminance values
// look up table mapping the scaling to luminance values
// current options: STANDARD or STRICT LUMINANCE
// signed output data in same length and format as input
// added in late february 1996 to begin work on 3 color 24 bit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         if (number_channels == 1) {

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Implementation file for the Document class of the Digimarc Signer. This defines the implementation of the document class (MFC) architecture, for the Signer. Under the Microsoft Foundation Class (MFC) architecture, the Document/View model is the preferred method. This header file defines our additions to the generic Document class created by the Visual C++ wizards.
                                                                                                                                                                                                                                                                                                            // Copyright (C) 1996 Digimarc Corporation, all rights reserved.

It sets up the necessary data structures needed by the core routine and makes the call.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             num_pixels = (long) signedImage.GetXDim() * signedImage.GetYDim();

If we have just eighed this image, then use the / true message bit array. Otherwise, we are trying to read without knowing the the true message, and use the estimated | message for computation of the metric.

                                                                                                                                                  Interface file for the CDibDoc class. This defines the document class for the Signer. Under the Microsoft Foundation Class (MFC) architecture, the Document/View model is the prefered method. This header file defines our additions to the generic Document class created by the Visual C++ wizards.

It determines the local overall again that should be applied to the given bump, then tweaks the individual pixel(s) of the output bump and stores in the temporary array which is later written out into the ultimate output array.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      long xbumpdim = xdim/bump_size; // calling routine guaranteed this would never have remainder
                                                                                                                                                                                                                                                                                                                                              using bitwise

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Main loop version 1 works in the following way. It is designed so that it can create a lagged version of the output in order to support either case of: A) where the input data array is replaced with the output array (in place), or B) where the "data out pointer is not null and is the actual output array.

THIS PARTICULAR VERSION EXPECTS case B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        copy the arrays downward

á The goal of the signing process, beyond simply functioning, is to maximize the "numeric detectability" of an embedded signature while meeting some form of fixed "visibility/acceptability threshold" set a given user/creator. In service to design toward this goal, imagine the following three axis yaparameter space, where two of the axes are only half-axes (positive only), and the third is a full axis (both negative and positive). This set of axes define two of the usual eigth octal spaces of euclidean 3-space. As things refine and "deservedly separable" parameters show up on the scene (such as "extended local visibility metrics"), then they can define their own (generally) half-axis and extend the following example beyond three dimensions.

The signing design goal becomes optimally assigning a "gain" to a local bump based on its coordinates in the above defined space, whilst keeping in mind the basic needs of doing the operations fast in real applications. To begin whith, the three axes are the following. We'll call the two half axes x and y, while the full axis will be z.

The x axis represents the luminance of the singular bump. The basic idea is that you can squeeze a little more energy into bright regions as opposed to dim ones. It is important to note that when true "psycho-linear device independent" luminance values (pixel DN's) come along, this axis might become superfluous, unless of course if the luminance value couples into the other operative axes (e.g. C*xy). For now, this is here as much due to the sub-optimality of current quasi-linear luminance coding.

changes The y axis is the kitchen sink of "local hiding potential" of the neighborhood within which the bump finds itself. The basic idea is that fall tegions have a low hiding potential since the eye can detect subtle change. In such regions, whereas complex textured regions have a high hiding potential. Long lines and long edges tend toward the lower hiding potential since "breaks and choppiness" in nice smooth long lines are also somewhat visible, while shorter lines and edges, and mosaics thereof, tend toward the higher hiding potential. These latter notions of long and short are directly connected to processing time issues, as well to issues of the engineering resources needed to carefully quantify such parameters. Developing the working model of the y-axis will intervitably entail one part theory. To one part potchy-artist-empiricism. As the parts of the hodge-podge y-axis become better known, they can splinter off into their own independent axes if its worth it. The z-axis is the "with or against the grain" axis which is that a given input bump opposed to the other two half-axes. The basic idea is that a given input bump has a pre-existing bias relative to whether one wishes to encode a '1' or a '0' at its location, which to some non-trivial extent is a function of the reading algorithms which to some non-trivial extent is a function of the reading to the "hiding potential" of the 'y-axis, and ... fortunately..., can be used advantageously as a variable in determining what magnitude of a tweak value is assigned to the bump in question. The concommitant basic idea is that when a bump is already your friend or even your friend in a big way, then why mess with it like a four year old discovering how flat slugs can get underfoot. The really more toward a local blurring operation as opposed to a local sharpening operation as opposed to a local sharpening operation, and thus has somewhat less visibility per numeric tweak unit.

The above general description of the problem should suffice for many years. Clearly adding in chrominance issues will expand the defintions a bit, leading to a bit more signature bang for the visibility, and human visibility recearch which is applied to the problem of compression can equally be applied to this area but for diametrically opposed reasons. Facinaring possibilities truly. But alas, I am required to crank out some pot-shot first system which needs must neglect vast areas of the above general arenas. Here are its principles.

For speed's sake, local hidding potential will be calculated only based on a 3 by 3 inaginochrood of pixels, the center one being signed and its eight neighbors. Beyond speed issues, there is also no data or coherent theory to support anything larger as well. The design issue boils down to canning the y-axis visibility thing, how to couple the luminance into this, and a little bit on the friend/enewy asymetry thing zero, a classic pure maxima or minima region a "1.0" or the highest value, and to have local lines", "smooth slopes", "saddle points" and whatnot fall out somewhere in between In other words, let's pull out the darts and throw a few and see if any land on the board.

following code has six basic parameters that will be used:

difference from local average the asymetry factor (with or against the grain) minimum linear functor (our crude attempt at flat v. lines v. maxima) bit plane bias factor

Even this list above can get complicated in their inter-relations and especially in our current lack of expirimental data to support various specific formulas. 6) global gain (the user's single top level gain knob)

algorithms going).

It has asymetry factor is a single scalar applied to the "against the grain" side of the difference axis of number 2 directly above, as well and being modified by the minimum linear funkthess factor below. [Certainly to the minimum linear funkthess factor is admitted but it should when date and theory supports such].

When date and theory supports such].

The minimum linear tunkiness factor is admittedly crude but it should be of some service even in a 1 by 3 neighborhood setting. The idea is that the true 2D local minima and maxima will be highly perterbed along each of the four linear profiles.

Innear profiles. [The four linear profiles are each 3 pixels in length, i.e., the top light concept center - bottom tight, the top center - bottom the center pixel of the state one of the four linear profiles. [The four linear profiles are each 3 pixels in length, i.e., the top light - center - bottom left, the right center - bottom the center;] Left's choose some metric of "funkiness" or entropy as applied to three pixels in a row, perform this on all four linear profiles, then choose the minimum value for our ultimate parameter to be used as our 'y-axis'. Cheers to she or he who will take all of this to the next levels of refinement.

S) The bit plane bias factor is an interesting creature with two faces, the pre-emptive face and the post-emptive and leave the others all the biases which are, in total, soing against your desired message, and leave the others alone or even slightly lower their against your desired message, and leave the others alone or even slightly lower their against your desired message, and leave the others alone or even slightly lower their again. In the post-emptive modaliction, you churn out the whole you compare explice with the pre-emptive modaliction, you churn out the which bit planes are struggling or even in error, you apportantly beet up the image, and then you run through the process leaves the planes are struggling or even in error, you apportant scanning of the im t luminance is straightforward difference from local average is also, and is rather important the difference from local average is will directly eb involved in first generation sudff since it will directly eb involved in wing signatures (assuming we don't get fancy phase-only reading the signatures (assuming we don't get fancy phase-only reading the signatures (assuming we don't get fancy phase-only reading the signatures (assuming we don't get fancy phase-only reading the signatures (assuming we don't get fancy phase-only reading the signature of the signature o

maybe I'we ever done; tommenting I've ever done, I must be getting maybe I'w just realizing it would be nice to leave a signpost or tw this first dart throwing.
